Welcome, Innovative Carriers Team

> Dear Innovative Carriers team,
>
> Thank you for partnering with **Advanced Automations**. We built Jerry — your dedicated billing assistant — to take the manual burden off your accounting and dispatch teams so you can move freight with confidence and get paid faster.
>
> This introduction describes everything Jerry does for Innovative Carriers today: what runs automatically in ShipPrimus, when your team receives a helpful email, and how each notification guides you to a quick resolution. Our goal is simple — less paperwork, fewer errors, and a billing process that feels like an extension of your own team.

What Jerry delivers for Innovative Carriers
Faster invoice turnaround, fewer manual entry mistakes, proactive alerts when a human decision is needed, and a daily email summary for the appropriate operations contact — all integrated with your ShipPrimus workflow and visible on your operations dashboard.

Jerry at a Glance

Jerry is always on — monitoring your Outlook accounting inbox, working inside ShipPrimus, and keeping the appropriate operations contacts and dispatch in the loop only when needed.

- **Watch** — Monitors your Outlook invoice mailbox for carrier bills, insurance spreadsheets, and special requests.

- **Match** — Links each document to the correct load using load number, PRO, BOL, order number, PO, and other references.
- **Validate** — Compares carrier charges against booked rates, lumpers, accessorials, and Primus invoice actuals.
- **Complete** — Finishes invoicing, payables, QuickBooks sync, and follow-ups — or emails your team with a clear action link.

End-to-End Workflow

From the moment a carrier email arrives to the moment your books are updated, Jerry follows a consistent, auditable path for every shipment.

1. **Outlook email arrives** — Jerry reads your connected Outlook inbox, classifies the message, and extracts attachments or portal download links.
2. **AI document parsing** — PDFs and spreadsheets are parsed for load number, PRO, carrier name, invoice amount, line items, POD images, and receipts.
3. **Primus lookup & validation** — Jerry finds the shipment in ShipPrimus, compares amounts, checks for duplicates, and validates lumpers and accessorials.
4. **Carrier bill posted** — Validated carrier bills are uploaded to ShipPrimus; costs are entered and the customer invoice workflow begins.
5. **Customer invoice & email** — Customer invoices are created, reviewed when configured, and emailed with Innovative Carriers payment instructions.
6. **Payables & QuickBooks** — Carrier payables advance through approval; data syncs to QuickBooks.
7. **Daily activity email** — At 6 PM Eastern, Jerry emails the appropriate operations contact an itemized list of every load invoiced, ignored, failed, or waiting for approval in the last 24 hours.

Carrier Invoice Intake

Intelligent document reading

- Reads carrier invoices from PDF and email attachments — including multi-invoice packets (e.g. LTL statement cover pages followed by individual freight bills).
- Extracts load number, PRO, carrier BOL, order number, PO, shipment reference, invoice amount, dates, and line-item charges.
- Matches each document to the correct shipment in ShipPrimus using multiple lookup keys when the load number alone is not present.
- Accepts small invoice PDFs when the filename looks like a carrier invoice (e.g. Forward Air `INV*.pdf` files).
- Downloads Apex Capital and similar portal invoices from PDF links inside the email when attachments are not present.

- Flags amount mismatches, duplicate submissions, missing proof documents, and unrecognized charges before billing proceeds.

Multi-key load matching

When a carrier bill references a BOL, order number, or PO instead of an Innovative load number, Jerry attempts resolution in ShipPrimus using every available reference field — reducing manual matching work for your team.

Reference on invoice	What Jerry does
Load number	Primary lookup — matched directly to ShipPrimus booking.
PRO number	Secondary lookup when load number is missing or incorrect.
Carrier BOL / order / PO	Additional keys used to find the correct shipment when needed.
No match found	Forwarded to billing review with extracted data for manual resolution.

Past-due invoice filter

- Detects carrier invoices that are past due or late-fee re-sends already in ShipPrimus.
- Logs and ignores each duplicate individually with load number and invoice number.
- Processes only net-new bills; statement-only emails forward for review when no freight invoice is found.

Rate & Amount Validation

- Compares the carrier bill to the booked carrier cost in ShipPrimus.
- Subtracts lumper charges from the invoice total before comparing base freight to the Primus rate.
- Auto-approves charges already reflected in the Primus carrier cost when totals match.
- Pauses and notifies dispatch when numbers do not align — with load number, carrier, and dollar amounts in plain language.
- Flags loads with profit below the $10 minimum threshold so dispatch can review customer rate vs. carrier cost.

Duplicate & re-submission protection

- Detects when the same carrier invoice has already been processed for a load.
- Prevents double-posting of carrier costs and duplicate customer invoice lines.

Proof of Delivery (POD)

Jerry treats proof of delivery as a gatekeeper for billing. Where a POD is required, your team gets a clear notice — not a surprise later in the process.

- Detects when a load is missing a POD in ShipPrimus before customer invoicing.

- Uploads POD documents from carrier emails directly onto the booking.
- Supports truckload, power-only, and drayage workflows with mode-appropriate rules.
- For truckload shipments without a POD, Jerry sends structured follow-up reminders to the carrier on a business-day schedule before escalating to your team.
- Retrieves FedEx Freight proof-of-delivery documents when applicable.
- Alerts the appropriate operations contact and dispatch when a POD shows damage, shortage, or other discrepancies.
- Creates dashboard tasks for signed-POD requests that need ops attention.

Customer Invoicing

- Creates and completes customer invoices in ShipPrimus using the correct customer rate.
- Sends professional customer invoice emails with Innovative Carriers payment instructions.
- Supports a reviewer approval step before a customer email is sent — with a full load summary and one-click approve/reject links.
- Handles power-only loads with unit numbers on the bill-to reference field.
- Holds customer email when a truckload POD is still missing — carrier billing continues, but your customer is not invoiced prematurely.
- Reuses existing issued invoices in Primus when present — preventing duplicate draft invoices and double freight lines.

Broker Commission Rules

When a load's profit falls below your company's 10% threshold, Jerry evaluates whether the broker's commission rate should be adjusted automatically in ShipPrimus.

> **Important: Profit % vs. GP%**
> Jerry uses the **Profit %** shown in the Primus invoice summary (profit divided by actual cost) — not GP% (profit divided by revenue). These are different numbers on the same load. Broker decisions always follow Primus Profit %.

Scenario	Jerry's action
Profit % ≥ 10%	No commission change — load proceeds normally.
Profit % < 10%, broker has 10% variant	Automatically swaps broker to the 10% sales-rep code in ShipPrimus.
Profit % < 10%, Karen Adams	Exempt — commission is never changed for designated brokers.
Profit % < 10%, no 10% variant exists	The appropriate person is notified; invoicing continues without blocking the load.
Insurance premium posted to load	Fresh Profit % review runs after the premium is added.

Daily broker swap report

When Jerry automatically swaps a broker to the 10% sales-rep code, that change is logged with load details, carrier, customer rate, shipment cost, profit, margin, and the from/to rep. At **6:00 PM Eastern**, Jerry sends the appropriate operations contact a **separate daily email** listing every broker commission swap from the last 24 hours — even when there were no swaps that day, so you know the report ran.

Additional Charges & Accessorials

- Detects lumper, detention, reweigh, and other accessorial charges on carrier invoices.
- Routes four-option approval requests when a charge needs a human decision: pay carrier, bill customer, dispute, or other resolution paths.
- Skips unnecessary dispatcher notifications when the carrier total already matches Primus.
- Requires supporting receipts for certain charge types before auto-approval.
- Creates dashboard tasks for open additional-charge items so nothing is lost between emails.
- Supports dispute and resolution workflows when a charge is rejected.

Cargo Insurance (Redkik)

- Processes Redkik cargo insurance emails with invoice PDF, ACH authorization, and Excel allocation spreadsheet.
- Extracts invoice number and total premium from the insurance invoice PDF.
- Allocates premiums across shipments listed in the spreadsheet and posts insurance charges to each load in ShipPrimus.
- Skips loads that already have insurance posted (idempotent re-runs).
- Sends reconciliation summaries showing posted, skipped, and manual-review items.
- Triggers a broker commission Profit % review after insurance is posted to each load.

Special Email Handlers

Not every email is a carrier invoice. Jerry recognizes several special message types and handles them without forwarding noise to your team.

- **Apex Capital** — Downloads invoice PDFs from portal links when no attachment is present. Alerts the appropriate person if the link requires login or returns an error.
- **POD requests** — Looks up the load and sends the signed POD from ShipPrimus, or escalates to the appropriate operations contact when needed.
- **eModal broadcasts** — Port and drayage notifications are classified and ignored when they are not actionable invoices.
- **Administrative / RTS NOA** — Non-invoice broadcasts (Notice of Assignment, statements without freight bills) are routed or ignored appropriately.
- **Forward Air & small PDFs** — Compact invoice PDFs are processed when the filename indicates a carrier bill (e.g. `INV*.pdf`).

Carrier Payables & QuickBooks

- Marks shipments delivered in ShipPrimus when billing criteria are met.
- Advances carrier bill approval through your established workflow.
- Syncs carrier payables to QuickBooks so your books stay current with operations.
- Validates vendor bill amounts against ShipPrimus before sync.

Operations Dashboard

Your team dashboard is at **www.advancedautomations.net/innovative-carriers/** — one place to monitor Jerry's workload, open tasks, and recent invoices.

Dashboard features

- **Outlook connection status** — confirms Jerry is connected and polling your invoice mailbox in Outlook.
- **Statistics** — invoices processed by day, week, month, and year; includes loads with additional charges.
- **Recent invoices** — quick view of the latest completed and in-progress workflows.
- **Open tasks** — items forwarded for review: additional charges, signed POD requests, human-review escalations, and similar.
- **Dismiss tasks** — mark each task handled when resolved so the queue stays clean.
- **Support chat** — ask questions about recent activity and get guided answers.

> **Live activity log removed**
> The dashboard no longer shows a scrolling per-flow log feed. Instead, Jerry sends the appropriate operations contact a **daily activity email at 6:00 PM Eastern** listing every load and action from

the last 24 hours — one line per invoice processed, approval waiting, POD email sent, past-due ignored, billing failure, etc.

Who gets notified vs. who uses the dashboard

Channel	Used for
Dispatcher email	Operational items: missing customer, low profit, rate mismatches, POD issues.
Operations / accounting email	Financial exceptions: broker commission swaps, charge approvals, POD discrepancies.
Dashboard tasks	Persistent open items that need ops attention — visible until dismissed.

Other automated reports

- **Daily Jerry activity digest** — emailed to the appropriate operations contact at 6 PM ET; lists every load and action individually (OpenAI-polished wording).
- **Weekly undelivered shipment report** — dispatchers receive loads picked up more than two weeks ago with no delivery date.
- **Stuck workflow monitoring** — Jerry watches for invoices that stopped mid-process and can alert your team.

Daily Activity Report

Every evening, OpenAI reads Jerry's logs from the past 24 hours and emails the appropriate operations contact a full itemized digest — **one line per load or event**, never grouped counts. Examples (sample format only):

- *Invoiced load #123456 (Example Carrier) — $1,250.00, Primus #98765.*
- *Invoiced load #123457 (Sample Logistics) — $890.00, Primus #98766.*
- *Waiting on customer email approval — load #123458.*
- *Ignored past-due re-send — load #123400, invoice #INV-1001.*
- *Sent missing-rate alert — load #123459.*
- *Billing failed — load #123460: missing reference on charge line.*
- *Sent POD follow-up — load #123461.*
- *Forwarded for human review — no processable invoice PDF.*

Use this email as your end-of-day operations snapshot. Each line lists the actual load numbers, carriers, amounts, and Primus invoice numbers from that day.

Shipment Modes Supported

- **Truckload (TL)** — POD required; structured carrier follow-up; customer email held until POD is on file.
- **Power Only** — Trailer photos and unit-number billing references on customer invoices.
- **Drayage** — Mode-aware validation and billing; eModal broadcasts filtered appropriately.
- **LTL** — Multi-invoice PDF handling with statement cover pages and nested freight bills.
- **FedEx Freight** — Automated proof-of-delivery retrieval where configured.

What to Expect in Every Jerry Email

- A plain-language explanation of what happened and why — written for dispatch and accounting, not engineers.
- Load number, carrier name, and relevant dollar amounts clearly displayed.
- A direct button to fix the issue when action is needed (set customer rate, approve a charge, approve customer email, resume workflow, etc.).
- Confirmation pages on sensitive actions so nothing happens from an accidental click or email scanner.
- The right people copied — dispatchers for operational items, operations and accounting for financial exceptions.
- Profit % (not GP%) shown on broker commission notifications when a percentage is included.

Support & Contact
