Welcome, Innovative Carriers Team

Dear Innovative Carriers team,

Thank you for partnering with **Advanced Automations**. We built Jerry — your dedicated billing assistant — to take the manual burden off your accounting and dispatch teams so you can move freight with confidence and get paid faster.

This guide describes everything Jerry does for Innovative Carriers today: what runs automatically in ShipPrimus, when your team receives a helpful email, and how each notification guides you to a quick resolution. Our goal is simple — less paperwork, fewer errors, and a billing process that feels like an extension of your own team.

— The Advanced Automations Team

AdvancedAutomations.net

What Jerry delivers for Innovative Carriers

Faster invoice turnaround, fewer manual entry mistakes, proactive alerts when a human decision is needed, and a complete activity history on every load — all integrated with your ShipPrimus workflow and visible on your operations dashboard.

Jerry at a Glance

Jerry is always on — monitoring your accounting inbox, working inside ShipPrimus, and keeping Lisa and dispatch in the loop only when needed.

HUMAN ESCALATION

Full

ACTIVITY HISTORY

Watch

Monitors your invoice mailbox and picks up new carrier bills, insurance spreadsheets, and special request emails automatically.

Match

Links each document to the correct load using load number, PRO, BOL, order number, PO, and other reference fields.

Validate

Compares carrier charges against booked rates, lumpers, accessorials, and Primus invoice actuals before billing proceeds.

Complete

Finishes invoicing, payables, QuickBooks sync, and follow-ups — or asks for help with a clear email and one-click action link.

End-to-End Workflow

From the moment a carrier email arrives to the moment your books are updated, Jerry follows a consistent, auditable path for every shipment.

1

Email arrives

Jerry reads the inbox, classifies the message (carrier invoice, insurance, POD request, administrative, etc.), and extracts attachments.

2

AI document parsing

PDFs and spreadsheets are parsed for load number, PRO, carrier name, invoice amount, line items, POD images, and supporting receipts.

3

Primus lookup & validation

Jerry finds the shipment in ShipPrimus, compares amounts, checks for duplicates, and validates lumpers and accessorials.

4

Carrier bill posted

Validated carrier bills are uploaded to ShipPrimus; costs are entered and the customer invoice workflow begins.

5

Customer invoice & email

Customer invoices are created, reviewed when configured, and emailed with Innovative Carriers payment instructions.

6

Payables & QuickBooks

Carrier payables advance through approval; data syncs to QuickBooks so accounting stays current with operations.

Carrier Invoice Intake

Intelligent document reading

- Reads carrier invoices from PDF and email attachments — including multi-invoice packets (e.g. LTL statement cover pages)

- Matches each document to the correct shipment in ShipPrimus using multiple lookup keys when the load number alone is not present.
- Flags amount mismatches, duplicate submissions, missing proof documents, and unrecognized charges before billing proceeds.

Multi-key load matching

When a carrier bill references a BOL, order number, or PO instead of an Innovative load number, Jerry attempts resolution in ShipPrimus using every available reference field — reducing manual matching work for your team.

Reference on invoice	What Jerry does
Load number	Primary lookup — matched directly to ShipPrimus booking.
PRO number	Secondary lookup when load number is missing or incorrect.
Carrier BOL / order / PO	Additional keys used to find the correct shipment when needed.
No match found	Forwarded to billing review with extracted data for manual resolution.

Rate & Amount Validation

- Compares the carrier bill to the booked carrier cost in ShipPrimus.
- Subtracts lumper charges from the invoice total before comparing base freight to the Primus rate.
- Auto-approves charges already reflected in the Primus carrier cost when totals match.
- Pauses and notifies dispatch when numbers do not align — with load number, carrier, and dollar amounts in plain language.
- Flags loads with profit below the \$10 minimum threshold so dispatch can review customer rate vs. carrier cost.

Duplicate & re-submission protection

- Detects when the same carrier invoice has already been processed for a load.
- Prevents double-posting of carrier costs and duplicate customer invoice lines.

Proof of Delivery (POD)

Jerry treats proof of delivery as a gatekeeper for billing. Where a POD is required, your team gets a clear notice — not a surprise later in the process.

- Detects when a load is missing a POD in ShipPrimus before customer invoicing.
- Uploads POD documents from carrier emails directly onto the booking.
- Supports truckload, power-only, and drayage workflows with mode-appropriate rules.
- For truckload shipments without a POD, Jerry sends structured follow-up reminders to the carrier on a business-day schedule before escalating to your team.
- Retrieves FedEx Freight proof-of-delivery documents when applicable.
- Alerts Lisa and dispatch when a POD shows damage, shortage, or other discrepancies.
- Creates dashboard tasks for signed-POD requests that need ops attention.

Customer Invoicing

- Creates and completes customer invoices in ShipPrimus using the correct customer rate.
- Sends professional customer invoice emails with Innovative Carriers payment instructions.
- Supports a reviewer approval step before a customer email is sent — with a full load summary and one-click approve/reject links.
- Handles power-only loads with unit numbers on the bill-to reference field.
- Holds customer email when a truckload POD is still missing — carrier billing continues, but your customer is not invoiced prematurely.
- Reuses existing issued invoices in Primus when present — preventing duplicate draft invoices and double freight lines.

Broker Commission Rules

When a load's profit falls below your company's 10% threshold, Jerry evaluates whether the broker's commission rate should be adjusted automatically in ShipPrimus.

Important: Profit % vs. GP%

Jerry uses the **Profit %** shown in the Primus invoice summary (profit divided by actual cost) — not GP% (profit divided by revenue). These are different numbers on the same load. Broker decisions always follow Primus Profit %.

Scenario	Jerry's action
Profit % $\geq$ 10%	No commission change — load proceeds normally.
Profit % < 10%, broker has 10% variant	Automatically swaps broker to the 10% sales-rep code in ShipPrimus.
Profit % < 10%, Karen Adams	Exempt — commission is never changed for designated brokers.
Profit % < 10%, no 10% variant exists	Lisa is notified; invoicing continues without blocking the load.
Insurance premium posted to load	Fresh Profit % review runs after the premium is added.

Additional Charges & Accessorials

- Detects lumper, detention, reweigh, and other accessorial charges on carrier invoices.
- Routes four-option approval requests when a charge needs a human decision: pay carrier, bill customer, dispute, or other resolution paths.
- Skips unnecessary dispatcher notifications when the carrier total already matches Primus.
- Requires supporting receipts for certain charge types before auto-approval.
- Creates dashboard tasks for open additional-charge items so nothing is lost between emails.
- Supports dispute and resolution workflows when a charge is rejected.

Cargo Insurance (Redkik)

- Allocates premiums across shipments listed in the spreadsheet and posts insurance charges to each load in ShipPrimus.
- Skips loads that already have insurance posted (idempotent re-runs).
- Sends reconciliation summaries showing posted, skipped, and manual-review items.
- Triggers a broker commission Profit % review after insurance is posted to each load.

Special Email Handlers

Not every email is a carrier invoice. Jerry recognizes several special message types and handles them without forwarding noise to your team.

Apex / administrative

Recognizes administrative broadcast emails and marks them as intentionally ignored — no false billing alerts.

POD requests

When someone requests a signed POD, Jerry looks up the load and sends it from ShipPrimus — or escalates to Lisa when needed.

eModal broadcasts

Port and drayage system notifications are classified and ignored when they are not actionable invoices.

Carrier Payables & QuickBooks

- Marks shipments delivered in ShipPrimus when billing criteria are met.
- Advances carrier bill approval through your established workflow.
- Syncs carrier payables to QuickBooks so your books stay current with operations.
- Validates vendor bill amounts against ShipPrimus before sync.

Operations Dashboard

Your team has a live operations dashboard at **advancedautomations.net** — one place to monitor Jerry's activity across Innovative Carriers.

Dashboard features

- **Gmail connection status** — confirms Jerry is connected and polling your invoice mailbox.
- **Statistics** — invoices processed by day, week, month, and year; includes loads with additional charges.
- **Recent invoices** — quick view of the latest completed and in-progress workflows.
- **AI-summarized activity logs** — human-readable summaries of each workflow (not raw engine logs), with "show more" for detail.
- **Open tasks** — items forwarded for review: additional charges, signed POD requests, human-review escalations, and similar.
- **Dismiss tasks** — mark each task handled when resolved so the queue stays clean.
- **Support chat** — ask questions about recent activity and get guided answers.

Who gets notified vs. who uses the dashboard

Channel	Used for
Dispatcher email	Operational items: missing customer, low profit, rate mismatches, POD issues.
Lisa / accounting email	Financial exceptions: broker commission swaps, charge approvals, POD discrepancies.
Dashboard tasks	Persistent open items that need ops attention — visible until dismissed.

Other automated reports

- **Weekly undelivered shipment report** — dispatchers receive loads picked up more than two weeks ago with no delivery date.
- **Stuck workflow monitoring** — Jerry watches for invoices that stopped mid-process and can alert your team.

Shipment Modes Supported

Truckload (TL) POD required; structured carrier follow-up schedule; customer email held until POD is on file.	Power Only Trailer photos and unit-number billing references supported on customer invoices.	Drayage Mode-aware validation and billing steps; eModal broadcasts filtered appropriately.
LTL Multi-invoice PDF handling — statement cover pages with nested freight bills parsed correctly.	FedEx Freight Automated proof-of-delivery retrieval and carrier-specific validation where configured.	

What to Expect in Every Jerry Email

- A plain-language explanation of what happened and why — written for dispatch and accounting, not engineers.
- Load number, carrier name, and relevant dollar amounts clearly displayed.
- A direct button to fix the issue when action is needed (set customer rate, approve a charge, approve customer email, resume workflow, etc.).
- Confirmation pages on sensitive actions so nothing happens from an accidental click or email scanner.
- The right people copied — dispatchers for operational items, Lisa and accounting for financial exceptions.
- Profit % (not GP%) shown on broker commission notifications when a percentage is included.

We Are Always Here For You

Jerry runs around the clock so your team does not have to. When you need a person — whether it is a question about a paused load, a new workflow idea, or help with a specific shipment — **Advanced Automations** is always here for Innovative Carriers. Your success is our success.

Thank you for trusting us with your billing automation.
